

Cooling System Cleaner for Bus and Truck Radiators

To clean the radiators of large commercial type vehicles such as buses and trucks, 3 parts Oil Muncher may be added to the water in the radiator. Run the vehicle for 1 working day, allowing the engine to heat up, then drain the radiator and flush the system with clean water. Fill the radiator with clean water and add 3 ounces of Oil Muncher for normal driving use. This will eliminate expensive breakdowns and cleaning procedures. One tablespoon of baking soda should be added to the radiator for the prevention of electrolysis.
