

### **Electrical Equipment Applications**

Oil Muncher may be used in cleaning electrical components and equipment very effectively. In the aerospace industry it may be used to clean printed circuitry. Although Oil Muncher will remove various metal oxides and inhibit recorrosion, it will not cause any dimensional changes.

Oil Muncher may be used in cleaning electrical appliances, equipment and is very effective in overhaul and repair of such items as adding machines, typewriters, calculators, cash registers, computers, water meters, parking meters, telephone components, etc.

Oil Muncher may be used in ultrasonic cleaners. For jewelry and small parts baths, use a dilution of 1:10 parts water. Change bath solution when clarity is noticeable reduced. For larger industrial applications, use a dilution of 1:20 and a minimum pH of 9.5. Change solution when clarity is reduced by emulsion or solids which do not settle to the bottom or may not be removed by filter or hand screen.
