

## **Heavy Equipment**

Oil Muncher is a superior performing concentrate designed for typical soils found on heavy field equipment in the oil field rigs, heavy earth moving machinery, etc. It can be applied by soak tank or pressure spray with or without water proportionately.

For oil field equipment, engine blocks, heavy road construction equipment, floors or any other surface where extra grease deposits occur, mix 1 part Oil Muncher to 3 parts water. Apply by a spray method. Oil Muncher in a concentrated solution usually works in about 20 to 30 minutes. When grease starts to slide, rinse with high pressure water. For light to medium grease, mix 1 part Oil Muncher to 15 parts water. Pre-soak when possible by placing parts in a bath for 20 to 30 minutes in 1 part Oil Muncher to 20 parts water.

A unique quality of Oil Muncher is that when left on a surface it will not completely evaporate. Leave the Oil Muncher on the surface overnight and wash it down the next day. The results will be the same as if you had finished the job in sequence.

It is important to realize that Oil Muncher inhibits rusting and corrosion of metals as long as there remains a small amount of it on the metal surface. However, if it is all thoroughly rinsed off with water, then the metal is left exposed and therefore subject to rusting as usual. To inhibit this occurrence, a light oil film may be applied to the surface of the metal.
