

Metal Processing

For metal processing activities such as Phosphating, Plating, Pickling, Machining and Forming, Oil Muncher can be used in any cleaning application in the process. Dilutions of the product will vary depending on the situation. Oil Muncher is an effective cleaner of all metals, yet aluminum can be etched by using too strong a concentration of cleaning solutions. As with cleaning aircraft exteriors, Oil Muncher mixtures should be diluted by ½ to clean aluminum as compared to steel or like metals.
